

Responsiveness

Frappe Charts are responsive, as they rerender all the data in the current available container width. To demonstrate, let's take the example of setting the `bar width` for bar charts.

In order to set the bar width, instead of defining it and the space between the bars independently, we simply define the **ratio of the space** between bars to the bar width. The chart then adjusts the actual size proportional to the chart container.

js

```
barOptions: {  
  spaceRatio: 0.2 // default: 1  
},
```

Try resizing the window to see the effect, with different ratio values.

spaceRatio: 0.2
